# About Thesis Defense

Defense is the security auditing arm of Thesis, Inc., the venture studio behind tBTC, Fold, Mezo, Acre, Taho, Etcher, and Embody. At Defense, we fight for the integrity and empowerment of the individual by strengthening the security of emerging technologies to promote a decentralized future and user freedom. Defense is the leading Bitcoin applied cryptography and security auditing firm. Our team of security auditors have carried out hundreds of security audits for decentralized systems across a number of ecosystems including Bitcoin, Ethereum + EVMs, Stacks, Cosmos SDK, NEAR and more. We offer our services within a variety of technologies including smart contracts, bridges, cryptography, node implementations, wallets and browser extensions, and dApps.

Defense will employ the Defense Audit Approach and Audit Process to the in scope service. In the event that certain processes and methodologies are not applicable to the in scope services, we will indicate as such in individual audit or design review SOWs. In addition, Thesis Defense provides clear guidance on successful Security Audit Preparation.

## Section 1.0 Scope

### Technical Scope

- **Repository:** <https://github.com/threshold-network/tbtc-v2/tree/main/cross-chain/bob/contracts>
- **Audit Commit:** dbefc8c0cbcd686b319a889b6589047cb4ed1f69
- **Verification Commit:** 4ad14049fab1a4b7f5a7b773fd53c4f66f2fdf70

# Section 2.0

## Executive Summary

### Schedule

This security audit was conducted from September 8, 2025 to September 15, 2025 by 2 security auditors for a total of 12 person-days.

### Overview

This audit covers two pull requests implementing the following changes:

#### Allowlist Contract Integration

The new `allowlist` smart contract replaces the `TokenStaking` smart contract as per TIP-092 and TIP-100. Staking is no longer required to operate nodes; instead, beta stakers are selected by the DAO and authorized via a DAO-managed `allowlist`. The contract integrates with the `WalletRegistry` smart contract and replaces previous `TokenStaking` calls.

#### Bridge Fee Rebate Model for T Stakers

A rebate mechanism was introduced for T stakers, granting fee rebates based on the amount of tokens staked. The model includes a cap enforced via a rolling window per token staked, scaling linearly with bridge usage, and includes an unstaking period.

### Tests

A comprehensive test suite is implemented.

### Project Documentation

We found comprehensive in the PR descriptions and inline documentation in the code.

# Section 3.0

## Key Findings Table

Issues	Severity	Status
ISSUE #1 Staking Provider Can Be Disabled Without Two-Step Process	<span style="color: yellow;">= Medium</span>	<span style="color: green;">✓ Fixed</span>
ISSUE #2 Missing Zero-Address Validation in the <code>finalizeUnstaking</code> Function	<span style="color: green;">✓ Low</span>	<span style="color: green;">✓ Fixed</span>
ISSUE #3 Lack of Zero Address Validation in <code>initialize</code> and <code>addStakingProvider</code> Functions	<span style="color: blue;">✗ None</span>	<span style="color: green;">✓ Fixed</span>
ISSUE #4 Missing Zero-Amount Validation in the <code>stake</code> Function	<span style="color: blue;">✗ None</span>	<span style="color: green;">✓ Fixed</span>
ISSUE #5 Missing Zero-Weight Check in the <code>addStakingProvider</code> Function	<span style="color: blue;">✗ None</span>	<span style="color: green;">✓ Fixed</span>
ISSUE #6 Cache Array Length in Loops for Gas Savings	<span style="color: blue;">✗ None</span>	<span style="color: green;">✓ Fixed</span>
ISSUE #7 Use Custom Errors to Save Gas	<span style="color: blue;">✗ None</span>	<span style="color: green;">✓ Fixed</span>
ISSUE #8 Unrestricted <code>seize</code> Function Allows Event Spam	<span style="color: blue;">✗ None</span>	<span style="color: red;">✗ Not Fixed</span>

Severity definitions can be found in [Appendix A](#)

# Section 4.0

## Findings

We describe the security issues identified during the security audit, along with their potential impact. We also note areas for improvement and optimizations in accordance with best practices. This includes recommendations to mitigate or remediate the issues we identify, in addition to their status before and after the fix verification.

ISSUE#1

### Staking Provider Can Be Disabled Without Two-Step Process

 Medium

 Fixed

#### Location

[contracts/Allowlist.sol#L109](#)

[contracts/Allowlist.sol#L138](#)

#### Description

The decrease of the weight of a staking provider is a two step process. However, a staking provider can be directly disabled by the `approveAuthorizationDecrease` function without first calling the `requestWeightDecrease` function. This results from `pendingNewWeight` defaulting to 0, with no explicit flag to verify that a decrease request was made.

#### Impact

This allows the `WalletRegistry` to potentially reduce a staking provider's weight to 0, bypassing the intended two-step process.

#### Recommendation

We recommend adding a `decreasePending` flag to track valid requests, requiring it in the `approveAuthorizationDecrease` function, and resetting it after finalization to ensure that the two-step process is followed.

ISSUE#2

### Missing Zero-Address Validation in the `finalizeUnstaking` Function

 Low

 Fixed

#### Location

[contracts/bridge/RebateStaking.sol#L324](#)

#### Description

The `finalizeUnstaking(address receiver)` function allows the `receiver` to be the zero address. This can lead to token transfers to `address(0)`, resulting in permanent loss of tokens.

#### Impact

Potential irreversible fund loss if tokens are sent to `address(0)`.

## Recommendation

We recommend adding a zero address check for the `receiver` to prevent potential permanent loss of funds.

ISSUE#3

## Lack of Zero Address Validation in `initialize` and `addStakingProvider` Functions

 None

 Fixed

### Location

[contracts/Allowlist.sol#L68](#)

[contracts/Allowlist.sol#L79](#)

### Description

The smart contract does not validate that the `stakingProvider` parameter in the `addStakingProvider` function and `_walletRegistry` parameter in the `initialize` function are non-zero addresses. This means governance could register the zero address as a staking provider and configure the wallet registry to the zero address. Both actions leave the system in an inconsistent state.

### Impact

Setting the wallet registry to the zero address would render all registry-related functionality inoperable. Using the zero address as a provider results in non-functional providers that cannot be interacted with.

## Recommendation

We recommend adding zero address checks for `stakingProvider` and `_walletRegistry`.

ISSUE#4

## Missing Zero-Amount Validation in the `stake` Function

 None

 Fixed

### Location

[contracts/bridge/RebateStaking.sol#L301](#)

### Description

The `stake(uint96 amount)` function allows the `amount` to be zero, which results in a no-op transfer and unnecessary state changes. This can waste gas and create misleading `Staked` events.

### Impact

None.

## Recommendation

We recommend adding a check to prevent zero-amount stakes.

ISSUE#5

## Missing Zero-Weight Check in the addStakingProvider Function

 None

 Fixed

### Location

[contracts/Allowlist.sol#L79](#)

### Description

In the case where `parameters.minimumAuthorization == 0` in the `WalletRegistry` smart contract, the function `addStakingProvider` accepts a weight of `0` without reverting. This results in a staking provider being added with zero weight which can later be re-added with a non-zero weight, bypassing the uniqueness check that relies on:

```
if (info.weight != 0) {
    revert StakingProviderAlreadyAdded();
}
```

### Impact

When allowed by `WalletRegistry`, this can lead to duplicate additions and inconsistent event history, potentially confusing the monitoring logic.

### Recommendation

We recommend adding a check to revert when `weight == 0`.

ISSUE#6

## Cache Array Length in Loops for Gas Savings

 None

 Fixed

### Location

[contracts/bridge/RebateStaking.sol#L216](#) [contracts/bridge/RebateStaking.sol#L283](#)

### Description

Functions like `getRebateInRollingWindow` and `cancelRebate` iterate over `stakeInfo.rebates` using `i < stakeInfo.rebates.length` without caching the array length. This causes the array length to be read from storage on every iteration.

### Impact

Unnecessary repeated storage reads increase gas costs, especially for users with large `rebates` arrays.

### Recommendation

We recommend caching the array length in a local variable before the loop:

```
uint256 n = stakeInfo.rebates.length;
for (uint256 i = stakeInfo.rollingWindowstartIndex; i < n; i++) {...}
```

This saves gas by avoiding repeated `SLOAD` operations.

ISSUE#7

## Use Custom Errors to Save Gas

 None

 Fixed

### Location

[contracts/bridge/RebateStaking.sol#L94](#)

[contracts/bridge/RebateStaking.sol#L314](#)

### Description

The smart contract uses `require` statements with revert strings (e.g., “Amount cannot be 0”, “Unstaking already started”). Revert strings consume additional gas because they must be stored in the contract bytecode and returned on failure. This results in higher gas costs for deployments and reverts, especially on frequently called functions.

### Impact

None.

### Recommendation

We recommend defining and using custom errors instead of string-based require statements.

ISSUE#8

## Unrestricted `seize` Function Allows Event Spam

 None

 Not Fixed

### Location

[contracts/Allowlist.sol#L184](#)

### Description

The `seize` function is an external function that emits a `MaliciousBehaviorIdentified` event with arbitrary user-supplied data. Anyone can call it and emit unbounded-length events.

### Impact

This enables spam of on-chain logs, which may mislead off-chain monitoring systems or bloat event indexing.

### Recommendation

We recommend restricting the `seize` function to the appropriate authorized caller(s).

# Section 5.0

## Appendix A

At Thesis Defense, we utilize the [ImmuneFi Vulnerability Severity Classification System - v2.3](#).

Severity	Definition
 Critical	<ul style="list-style-type: none"><li>• Manipulation of governance voting result deviating from voted outcome and resulting in a direct change from intended effect of original results</li><li>• Direct theft of any user funds, whether at-rest or in-motion, other than unclaimed yield</li><li>• Direct theft of any user NFTs, whether at-rest or in-motion, other than unclaimed royalties</li><li>• Permanent freezing of funds</li><li>• Permanent freezing of NFTs</li><li>• Unauthorized minting of NFTs</li><li>• Predictable or manipulable RNG that results in abuse of the principal or NFT</li><li>• Unintended alteration of what the NFT represents (e.g. token URI, payload, artistic content)</li><li>• Protocol insolvency</li></ul>
 High	<ul style="list-style-type: none"><li>• Theft of unclaimed yield</li><li>• Theft of unclaimed royalties</li><li>• Permanent freezing of unclaimed yield</li><li>• Permanent freezing of unclaimed royalties</li><li>• Temporary freezing of funds</li><li>• Temporary freezing NFTs</li></ul>
 Medium	<ul style="list-style-type: none"><li>• Smart contract unable to operate due to lack of token funds</li><li>• Enabling/disabling notifications</li><li>• Griefing (e.g. no profit motive for an attacker, but damage to the users or the protocol)</li><li>• Theft of gas</li><li>• Unbounded gas consumption</li></ul>
 Low	<ul style="list-style-type: none"><li>• Contract fails to deliver promised returns, but doesn't lose value</li></ul>
 None	<ul style="list-style-type: none"><li>• We make note of issues of no severity that reflect best practice recommendations or opportunities for optimization, including, but not limited to, gas optimization, the divergence from standard coding practices, code readability issues, the incorrect use of dependencies, insufficient test coverage, or the absence of documentation or code comments.</li></ul>
